

Addendum to DJ Control MP3 User Manual

“5.3 – Previewing with headphones”

Contrary to what is indicated in the User Manual, if you have a stereo sound card, you cannot carry out headphone previewing, you will hear the mix in your speakers. However, you can add an external sound card with an output of 4 or more channels (such as the Hercules Muse Pocket LT sound card), and then carry out headphone previewing via the rear output.

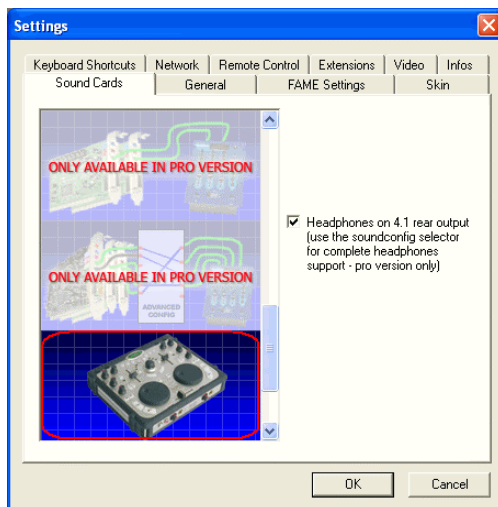

To use the headphone previewing mode on your multi-channel sound card:

- a) Check that your sound card’s speaker mode is set to 4-channel or 5.1-channel.

- b) Connect your headphones to the rear speakers plug on your sound card (black plug on Sound Blaster Live!).

- c) When you run VirtualDJ, activate headphones previewing by clicking on **Headphones on 4.1 rear output** (in VirtualDJ **Config/Sound Cards** window).

Each time you press one of the headphones monitoring button on DJ Control MP3, you hear the sound of the selected deck in your headphones. When you release the button, headphones previewing stops.
