

How can I verify that the DJ Control MP3 is working correctly as a MIDI controller?

Although it is possible to test the **DJ Control MP3** from within most applications that can use MIDI controller (such as Traktor DJ), we'll use a MIDI test program available from the following website:

MIDI Monitor

<http://obds.free.fr/midimon/>

The first thing to do upon launching **MIDI Monitor** is to configure it so the **DJ Control MP3** is used as **MIDI-In Device**. If any other MIDI devices are present on your computer, select it using the drop down menu.

By default, the **MIDI In Device** should be **Open**. This is necessary for the software to be able to read the incoming data from the DJ Control.

Once done. Click on **Data Monitor**, which will bring you to the test page.

Start by pressing a button on the DJ Control. Under column **Data2**, you will notice a value of **127** (when pressing the button) and **0** (when releasing the button). This is also displayed under **Event History**.

For knobs and sliders, who are incremental controls, you should normally get values **between 0 and 127**, depending on the position of the controller. The **Event Value** should also display the relative position of the control being used according to the value.

This test can also help determine if some of the controls of the DJ Control MP3 are not working correctly. For example, if the crossfader is only halfway to his course but already displays its maximum value of 127.
